R Bubsequent protessomal degradation of target proteins. Has a role during synaptogenesis; negative regulator of synaptic growth.

-:- FUNCTION: B3 ubiquitin ligase proteins mediate ubiquitination and subsequent protessomal degradation of target proteins. Has a role during synaptogenesis; negative regulator of synaptic growth.

-:- PUNCTION: B3 ubiquitin conjugation; third step.

-:- PUNCTION: B3 ubiquitin ligase proteins mediate ubiquitination and around which the synaptic neuropil forms Expression. Stage 13

-:- SUBCELLULALAR LOCATION: Nucleus (By similarity).

-:- PATHWAY: Ubiquitin conjugation; third step.

-:- TISSUE SPECIFICITY: Nervous system specific expression outside the CNS starts at stage lin presynaptic terminals at the periactive cone which surround the active zone. NMJ and CNS expression is also seen in third instear larvae (at protein level).

-:- MISCELLANBOUS: Flies lacking hiw display NMJ synapses that grow exuberantly and are expanded in both the number of boutons and in the STMTIADITY. Contains at film in the synaptic contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

Bell D., Casey E.S., Harland R., Lovell-Badge R.;
"Expression of Sox3 throughout the developing central nervous system is dependent on the combined action of discrete, evolutionarily conserved, regulatory elements.; submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELDULAR LOCATION: Nucleus.
-!- TISSUE SPECIFICITY: Mainly in the developing central nervous system. Expressed in developing urogenital ridge.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Submitted (JAN-2004) to the EMBL/GenBank/DDBJ databases.
-!- DOMAIN: The RING-type zinc finger domain is essential for
-!- ubiquitin ligase activity. It coordinates an additional third zinc
ion (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

The present invention describes an isolated WHC class II compound (I) comprising: (a) an WHC class II component comprising at least a portion of an WHC class II alpha chain and at least a portion of an WHC class II beta beta chain, such that the WHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II component, Also described; (i) a pharmaceutical composition comprising the MHC class II compound; (3) a method of directly identifying producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of tregulating an immune response as unsubject; (5) a method of regulating an immune disorder in a subject; (6) a method of treating an immune disorder in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; (1) has vivicies, and can be used in gene therapy. The MHC class II compound (1) can be used for preparing a composition for treating immune activities, and can be used in gene therapy. The MHC class II compound infections, parasitic disease, autoimmunity or treating immune sequence represents a spaceholder molecule peptide, which can be used in sequence represents a spaceholder molecule peptide, which can be used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                 MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparastic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.

The invention relates to a new isolated lung specific nucleic acid molecule (I) comprising any of 113 fully defined nucleotide sequences of given in the specification, their encoded protein sequences.

C given in the specification, their encoded protein sequences care sequences at least 60% identity to the nucleotide sequences. The methods and car least 60% identity to the nucleotide sequences. The methods and compositions of the present invention are useful for identifying, classing, imaging and treating lung cancer and non-concernous diseases of the lung. They are also used for identifying lung crisus, monitoring and identifying and/or designing entagonists of the polypeptide of the invention, gene therapy, production of transgenic polypeptide of the invention of engineered lung tissue for treatment and creasarch. Lung specific genes (LSGS) were identified by a systematic research. Lung specific genes (LSGS) were identified by a systematic caragarch. Lung specific genes (LSGS) were identified by a systematic canalysis of gene expression data in the LIFESEQ Gold database using the data mining software package candidate lead automatic search program (CLASP). Genes were grouped into gene bins where each bin is a cluster of sequences grouped together where they share a common contig.

C percentage level in the targeted tissue versus all the other tissues. The common result is utissue libraries associated with tumour or disease. This sequence reparted the invention of the inventio

Sequence 13 AA;

the

polypeptide that can be used in the recombinant DNA construct of

```
The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the polymucleotide ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan,

New human genome-derived single exon nucleic acid probes useful for hume gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 45; SEQ ID NO 32001; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a method of 

```
contiguous amino acids of any of the above- mentioned amino acid sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression data by subscription, and a computer-readable catoriac medium which contains a database having a plurality of records catoriac medium which contains a database having a plurality of records catoriac medium which contains a database having a plurality of records catoriac medium which contains a database having a plurality of records catoriac methods and apparatus are useful in gene cypression analysis. The probes may be used as tools for surveying cited above. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising calternative splicing events, in detecting and characterising calterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic a human construction format directly from USPYO at this patent did not form part of the printed specification, but was consider and process and a part of the printed specification, but was near a contain the surface of the printed specification, but was near and the process and the process and the process and the printed specification, but was near the process and the process and the printed specification, but was near the process and the process and the printed specification, but was near the process and the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

N-PSDB; AAS79688

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 45860; 103pp; English

The invention relates to isolated polynucleotide (I) and polypeptide (II)

```
reaction (PCR) primers, oligomers, and for chromosome and gene mapping, reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence. (I) is useful in gene therapy techniques to restore normal cativity of (II) or torreat disease states involving (II). (II) is useful in gene therapy techniques to restore normal cativity of (III) or torreat disease states involving (II) (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders in classics, generate protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in displacement of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG3037 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the full of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 112 AA;

Roth DA, Lewis RV;

WPI; 2003-140616/13. N-PSDB; AAL51692. Expressing spider silk protein in a higher plant, by contacting a plant cell with silk protein encoding a gene linked to a gene that confers resistance to selection agent, and selecting cells that survive when incubated with the agent.

Claim 52; Fig 11; 114pp; English.

The invention comprises a method for expressing spider silk in a higher plant (e.g. arabidopsis, tobacco, tubers, sunflower, canola, alfalfa, soybean, maize, sorghum, wheat, cotton, small grains and rice). The method is useful for expressing spider silk in a higher plant. The silk

```

produced is useful in the production of fabrics, sutures, medical coverings, high-tech clothing, rope, reinforced plastics, and other applications in which various combinations of strength and elasticity are required. The present amino acid sequence represents a spider silk-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel spider silk proteins e.g. major ampullate spidroin 1-like (MaSp1) spider silk protein, major ampullate spidroin 2-like (MaSp2) spider silk protein, flagelliform (Flag)-like spider silk proteins comprising atypical repetitive motifs. Sequences of the invention are useful for producing fabrics, sutures, medical coverings, high-tech clothing, rope and reinforced plastics. They are used to make high-tech clothing, rope, sails, parachutes, wings on aerial devices (e.g. hand gliders), flexible tie downs for electrical components, sutures and as blomaterials for implantation (e.g. artificial ligaments or acrtic banding). Blomedical applications of the spider silk fibers involve use of natural and/or synthetic spider silk fibers in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sutures used in surgical procedures, including eye surgery, vascular closure, bowel surgery, cosmetic surgery, reconstructive surgery (e.g. nerve or tympanic membrane reconstruction) and central nervous system surgery. Natural and synthetic spider silk fibers are also used in the generation of antibiotic impregnated sutures and implant material and matrix material for reconstruction of bone and connective tissue. fibroin and different spider silk proteins. Synthetic spider silk fibers may be mixed with various plastics and/or resins to prepare a fiber-reinforced plastic and/or resin product. They are useful as structural reinforcement material in thermal injected plastics. The present sequence is Zorocrates species fibroin I protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal consectul for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polynucleotide sequences have applications in collapsed and polynucleotide sequences have applications of mutations capponshible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in collectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell in development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16175) and the encoded proteins (ABB2737-ABB372072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                 detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; secreted protein; SECP; cell proliferative disorder; cirrhosis;

The present invention relates to novel human secreted proteins (SECP) and polynucleotides encoding such proteins. SECP sequences are useful for diagnosing, treating and preventing cell proliferative disorders including cancer (e.g. arteriosclerosis, cirrhosis, hepatitis, psoriasis and atherosclerosis), developmental disorders (e.g. seizure disorders, renal tubular acidosis, anaemia, cataract and sensorineural hearing 10ss), meurological disorders (e.g. epilepsy, ischaemic cerebrovascular disease, Alzheimer's disease, Pick's disease, Huntington's disease, stroke, dementia, Parkinson's disease, amyotrophic lateral sclerosis, schizophrenic disorders, mental disorders including mood and anxiety, Tourette's disorder and muscular dystrophy), autoimmune/inlammatory disorders (e.g. acquired immunodeficiency syndrome (AIDS), allergy, adult respiratory distress syndrome (ARDS), asthma, autoimmune thyroiditis, Claim 85; Page 168-169; 192pp; English.

diabetes mellitus, Crohn's disease, glomerulonephritis, rheumatoid arthritis, atopic dermatitis, ulcerative colitis, trauma and viral, bacterial, fungal, parasitic, protozoal and helminthic infections) and cardiovascular disorders (e.g. congestive heart failure, ischaemic heart disease, angina pectoris, myocardial infarction, hypertensive heart disease, congenital heart disease and myocarditis). They are useful for creating knocking humanised animals or transgenic animals to model human diseases. Sequences of the invention are useful in somatic or germline gene therapy and in diagnostic purposes. They are also used as vaccines. The present sequence is human SECP-30 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant; transcription factor; transgenic plant; abiotic stress tolerance; osmotic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to codd, increased dermination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to heat, increased germination in heat, increased tolerance to freezing conditions, increased tolerance to levance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adam LJ, R

                                                                                                                                The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comparing the transcriptored-proteome of a specialised cell type implicated in a disease or condition with that of second specialised cell type, under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions, and specialised cell types under experimental conditions ABN77873-ABY78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourigenesis, anglogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated
                                                                                                                                                                                                                                                                                                                      pathology in a patient. The coding sequences and proteins are also useful for monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss
                            Identifying a gene involved in disease for treating hypoxia-regulated conditions, comprises comparing the transcriptome/protecome of two cell types under different conditions and identifying a differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to novel human secreted proteins (SECP) and polynucleotides encoding such proteins. SECP sequences are useful for diagnosing, treating and preventing cell proliferative disorders including cancer (e.g. arteriosclerosis, cirrhosis, hepatitis, psoriasis and atherosclerosis), developmental disorders (e.g. seizure disorders, cand atherosclerosis), developmental disorders (e.g. seizure disorders, cand tubular acidosis, anaemia, cataract and sensorineural hearing consistence. Alzheimer's disorders (e.g. epilepsy, ischaemic cerebrovascular disorders mentia, Parkinson's disease, Huntington's disease, Schizophrenic disorders, mental disorders including mood and anxiety, correcte's disorder and muscular disorders including mood and anxiety, disorders (e.g. acquired immunodeficiency syndrome (ADS), allergy, adult crespiratory distress syndrome (ARDS), asthma, autoimmune thyroiditis, disorders mellitus, Crohn's disease, glomerulonephritis, rheumatorid arthritis, atopic dermatitis, ulcerative colitis, trauma and viral, bacterial, fungal, parasitic, protozoal and helminthic infections) and cardiovascular disorders (e.g. congestive heart failure, ischaemic heart disease, angina pectoris, myocardial infarction, hypertensive heart disease, congenital heart disease and myocarditis). They are useful for creating knocking humanised animals or transgenic animals to model human ciseases, Sequences of the invention are useful in somatic or germiline con the present sequence is human SECP-26 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human secreted proteins and genes encoding the proteins, useful for treating, diagnosing and preventing cell proliferative, autoimmune/inflammatory, cardiovascular, developmental or neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yue H, Lee EA, Becha SD, Baughn MR, Yao MG, Tang YT;

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel comparities that all the polymetrides a polymetride encoded by the polymetrides of the polymetride of the polymetride by contacting the polymetride or peptide or peptide of the polymetric of the polymetride by contacting the polymetride or peptide or peptide or peptide by contacting the polymetride or peptide or peptide or peptide or peptide of the polymetride of the polymetrial peptide or proteins are useful as pharmaceutical agents and many disease-related proteins peptide of genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity or as targets of generation. Membrane proteins, disease-related proteins, disease-related proteins, creameration and genes or encoding them can be used as indicators for diseases (e.g. osteoporosis, encoding them can be used as indicators for diseases (e.g. osteoporosis, concert, the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1617-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the
complementary strand of a polymucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
complementary strand of a polymucleotide which comprises one of the 5602
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide which comprises a 5'-end
complementary strand of a polymucleotide complementary to a
polymucleotide comprises a 1 least 15 nucleotides and the combination of
the 5'-end sequence/3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
complementary full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
conditionally without any specialised methods. AAH03165 to AAH13628 and
AAH13631 to AAH13632 represent human anino acid sequences; and AAH3629 to AAH3622 represent
colligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-
length cDNAs defined in the specification, and for the detection and/or
diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                     Human; primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Saito K, Yamamoto J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-dell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABS97737-ABB72072). The sequence data for this patent did not form part of her printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila melanogaster daughter of legless (Doll) protein SEQ ID NO:6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Daughter of legless; Doll; wingless signalling pathway; cytostatic; gene therapy; cancer; tumour; neoplastic.

The present invention describes a nucleic acid sequence and its encoded polypeptide, which are part of at least one signalling pathway in insects and vertebrates. The nucleic acid sequence is the daughter of legless (dail) gene, as well as its homologues, fragments, derivatives, or functional or structural analogues. The polypeptide is the daughter of ediess (DOLL) procein, as well as its homologues, fragments, derivatives, or controlly and can be used in gene therapy. The daughter of derivatives, or functional or structural analogues. Doll sequences have cycostatic activity, and can be used in gene therapy. The doll nucleic acid, DOLL protein, or their homologues, derivatives or fragments can be used for developing a therapeutic and diagnostic compound (e.g. used for developing a therapeutic and diagnostic compound (e.g. arrinded RNA, or themical or naturally occurring compounds interfering cut differentiation or proliferation. Fragments of the doll DNA compounds interfering capter, differentiation or proliferation. Fragments of the doll DNA compounds interfering treatment or diagnosis of the doll DNA compounds interfering main doll sequences includes human tumours, (pre-) neophastic, compound interfering compounds includes human tumours, (pre-) neophastic, compounds interfering the present invention interfering the present invention interfering compounds includes human tumours, includes human tumours, includes human tumours in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid sequences of the Drosophila melanogaster Daughter of Legless gene and its encoded polypeptide, useful for developing therapeutic or diagnostic compound for treating or diagnosing e.g. tumors or cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        developmental biology; cell signalling; insecticide;

a POSH (plenty
                                                                                                  The present invention relates to a method of identifying an antiproliferative agent, comprising providing a POSH (plenty of SH3 domains) polypeptide and a test agent, and identifying the test agent that interacts with the POSH polypeptide. The POSH protein is a ubiquitin ligase enzyme. The method is useful for identifying agents for treating a neoplastic condition, preferably cancer selected from thyroid carcinoma, liver cancer (hepatocellular cancer), lung cancer, cervical cancer, ovarian cancer, renal cell carcinoma, lymphoma, osteosacoma, liposarcoma, leukaemia, breast carcinoma and breast adenocarcinoma. The present sequence is a protein sequence shown in the exemplification of the
 neoplasia,

                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL186176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

invention involves producing a recombinant POSH polypeptide. Also disclosed is a method for identifying an antiviral or antiapoptotic agent, comprising providing a POSH polypeptide and a test agent, and identifying a test agent that interacts with the POSH polypeptide. The POSH polypeptide comprises an SH3 or RING domain, where the test agent binds. The test agent is a polypeptide, an antibody, a small molecule or a peptidomimetic. The test agent that interacts with POSH decreases the maturation of a virus containing the PTAP or PPEY motif. The interaction with POSH and decreases the interaction between POSH and Gap polypeptide. Alternatively, identifying an antiviral agent comprises providing a POSH nucleic acid and a test agent, and identifying a test agent that binds to the POSH nucleic acid. The test agent is a contained of a ribozyme. The nucleic acids, polypeptides, compositions and enzyme or a ribozyme. The nucleic acids, polypeptides, compositions and methods of the invention are useful for treating virtual disorders, and and a test agent is a compositions and methods of the invention are useful for treating virtual disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly disorders caused by envelop viruses, retroid viruses and RNA viruses, including retroviruses, rhabdoviruses, lentiviruses and filoviruses. The current sequence represents the mouse POSH protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sednence

New complex comprising a Plenty Of SH3 (POSH) polypeptide and a POSH-associated kinase (POSH-AK) or its subunit, useful in preparing a composition for treating or preventing a POSH associated cancer.

Disclosure; SEQ ID NO 9; 163pp; English

The present sequence is the protein sequence of murine Plenty Of SH3 domains (POSH). The invention provides novel complexes of POSH

polypeptides and POSH associated kinases (POSH-AKB). An isolated, countied or recombinant complex comprising a POSH polypeptide and a POSH-AK but of a POSH-AK is claimed. The complex is used in methods for identifying agents that modulate an activity of POSH or POSH-AK by disrupting a complex of POSH and POSH-AK. These modulator agents can be used as antiviral agents, or as anti-apoptotic or anti-cancer agents in which a modulator agent will decrease the proliferation or survival of a POSH-associated cancer cell. The modulator agents may also inhibit thraftixing of a protein through the servetory pathway. An inhibitor of POSH, e.g. an agent that inhibits a POSH-AP, or an agent that inhibits posh, e.g. an agent that inhibits a POSH-AP, or an agent that inhibits complex containing and thence to treat a JMK pathway-associated disease. A posh or understain of the protein kinase (JMK) pathway in a coll and hence to treat a protein kinase A (PKA) associated disease. A method of enhancing interaction of a POSH polypeptide with a second protein in a cell comprises contacting the cell with an agent that inhibits phosphorylated POSH by PKA. An isolated, purified or crecombinant phosphorylated POSH polypeptide is claimed, which is phosphorylated POSH polypeptide is claimed, the sequence K/R-R-X-S/T-hydrophobic or R-X-X-S/T-hydrophobic. Also claimed is a portion of a POSH polypeptide including a consensus PKA possphorylation site and compensation at least one modified amino acid or postpidomimetic moiety, which inhibits PKA phosphorylation of POSH. ô cytostatic; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; antiviral; neuroleptic; central nervous system; POSH polypeptide; POSH-associated protein; POSH-AP; HERPUDI; Ubiquitin ligase; antiviral agent; anti-apoptotic agent; anti-cancer agent; neurological disorder progression disorder; Alzheimer's disease; Parkinson's disease; Huntington's disease; schizophrenia; Gaps ö Score 49; DB 8; Length 892; Pred. The present sequence is the protein sequence of murine POSH (plenty of SH3 domains), a ubiquitin ligase. The invention relates to POSH and to the discoverty of novel interactions between POSH and POSH and to proteins, especially HERPUDI. Methods are provided for modulating a process in which POSH participates by targeting HERPUDI or the POSH participates by targeting a process in which HERPUDI participates of EOSH and hence the POSH-mediated ubiquitination. The neurological disorder is selected from: Alzheimer's disease, Parkinson's disease, Huntington's disease, Pick's disease, Niemann-Pick's disease, Huntington's disease, depression and schizophrenia. The modulator agent is a short interfering RNA (siRNA) construct, a small molecule, an antibody or an antisense construct.
                                                                                                                                                                                                                                                                                                                                                              New complex of POSH polypeptides and POSH-associated protein (POSH-AP) useful for identifying an agent for treating neurological disorder e.g. Alzheimer's disease, Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              POSH; Cbl-b-associated protein; Virucide; Anti-HIV; Cytostatic; Immunosuppressive; Neuroprotective; Nootropic; HIV-1 infection; HIV-2 infection; cancer; neurological disease; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated, purified or recombinant complex (I) comprising a PoSH polypeptide and a PoSH-associated protein (POSH-AP) (a) or HERPUDI and a Ubiquitin ligase (b). Methods using (I), (a) or (b) are useful for identifying an agent that modulates an activity of a POSH polypeptide or POSH-AP, for identifying an antiviral agent, an anti-apoptotic agent, an anti-cancer agent, an agent that inhibits trafficking of a protein through the secretory pathway, an agent that inhibits the progression of a neurological disorder, an agent that modulates a POSH function, an agent that modulates a HERPUDI function. The methods can be used for treating a viral infection, for inhibiting an activity of a POSH-associated disease is viral infection, POSH-associated cancer or POSH-associated disease is viral infection, POSH-associated cancer or POSH-associated neurological disorder. The methods are useful for treating or preventing POSH-associated neurological disorder. The methods are useful for treating or preventing POSH-associated neurological disorder in a subject e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, schizophrenia, Niemann-Pick's disease. This sequence corresponds to a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated, purified or recombinant complex, useful for identifying an antiviral, anti-apoptotic or anti-cancer, comprising POSH polypeptide and POSH-associated protein (POSH-AP).

                                                                                                                                                                                                                                                         The present sequence is the protein sequence of mouse POSH. The invention relates to novel associations between Cbl-b and POSH. Cbl-b and POSH are involved in viral maturation, including the production, post-translational processing, assembly and/or release of proteins in a viral particle. Viral infections may be ameliorated by inhibiting an activity (e.g. ubiquitin ligase activity or target protein interaction) of POSH or cbl-b. The virus is a retroid virus, an RNA virus or an envelope virus, especially a human immunodeficiency virus. A claimed method of identifying an antiviral agent comprises identifying a test agent that disrupts a complex of a Cbl-b polypeptide and a POSH polypeptide. A claimed method of treating a viral infection comprises administering an agent that inhibits the expression activity of Cbl-b. The agent is preferably an siRNA construct ADU73816 that inhibits especial
                                                                                                                                                                                                                                                                                                                                                                                                                                                 of human Cbl-b, an antisense construct, an antibody, a polypeptide or a small molecule. Also claimed are: methods of identifying and evaluating agents that modulate a Cbl-b or PoSH function by measuring the effect of the agent on Cbl-b-mediated or PoSH-mediated builduitination or on budding, release, infectivity or reverse transcriptase activity of a virus or virus-like particle; methods of identifying an anti-apoptotic agent, an anti-cancer agent or an agent that inhibits progression of a neurological disorder, where the agent disrupts a complex comprising Cbl-b and PoSH (or a CBl-b-associated protein such as POSH); and methods of
                                                                                                                                                          New isolated, purified or recombinant complex comprises a Cbl-b polypeptide, a POSH polypeptide, useful for treating Cbl-associated diseases, e.g. cancer, viral infection, disorders of the immune system,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating or preventing a POSH-associated cancer, POSH-associated neurological disorder or POSH-associated viral disorder using an agent that inhibits the expression or an activity of a Cbl-b polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel method for modulating the activity or localization of a trans-Golgi network (TGN) -associated protein. The method involves modulating the activity of one or more TGN-associated or proteins chosen from plenty of SH3 domains protein (PoSH), a POSH-pathway CC proteins chosen from plenty of SH3 domains protein (PoSH), a POSH-pathway polypeptide, a PoSH-associated polypeptide or a POSH binding protein. The method of the invention demonstrates neuroprotective, nootropic, contidiabletic, antinflammatory, virucide, antibacterial, antiparsitic, immunosuppressive, antiparkinsonian, anticonvulsant, neuroleptic, cytostatic and CNS-Gen applications. The method of the invention may be cytostatic and CNS-Gen applications. The method of the invention may be cytostatic and CNS-Gen applications. The method of the invention may be cytostatic and CNS-Gen applications. The method of the invention may be cytostatic processing of a protein associated with a neurological disorder, of a viral, bacterial, parasitic or microbial protein, and for inhibiting cardiovascular disease or immunological disorder, in the subject, where the subject exhibits a neurological disorder chosen from Alzheimer's disease and prion-associated disease, parkinson's disease and prion-associated disease, preferably con immunological disorder chosen from an inflammatory disease or an autoimmune disease, such as diabetee or a disease associated with a neoplastic impunological disorder plycosylation, where the improper glycosylation is N-linked cylycosylation in a subject having cancer. The cancer is chosen from thyroid cancer, only a protein such as a myristylated protein, and for inhibiting cancer, nepatocellular cancer, lung cancer, cervical cancer, hepatocellular cancer, lung cancer, cervical cancer, hepatocellular cancer, lung cancer, colorectal cancer, hepatocellular secured cancer, lung cancer, colorectal cancer, protein secured cancer, lung cancer, colorectal cancer, protein serviced protein protein serviced cancer, lungman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        carcinoma and breast adeno-carcinoma, preferably breast cancer or colorectal cancer. The current sequence is that of a POSH protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8; Length 892;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 892 AA;

This invention describes a novel small molecule inhibitor of a POSH polypeptide chosen from human Cbl-b polypeptide, a human PEM-3-like polypeptide, a SIAH1 polypeptide or a TTG3 polypeptide, comprising a RING domain. The POSH polypeptide is ARIN2, AFESA1, BANP1, BAT3, BARN1, BAT3, BCAR1, BCB9, BIA2, BRD4, CLK2, COLTA1, DAP, DDX31, DKF2P434B1231, DKF2P76LA052, CIC, CL25084, CLK2, COLTA1, DAP, DDX31, DKF2P434B1231, DKF2P76LA052, DLG5, DNM2, DRP2, EEFIA1, EGLN2, EIFAB121, DKF2P76LA052, CIC, CL25084, CL313479, FU31474, FST11, GC20, GLU1, HEBP2, CLJ13131, KLA1391, LAMA5, LOC118987, LOC20987, MADH6, MAP1A, MBD2, MRP136, MT2A, NAP4, NQO2, NUMA1, OPTN, PA1-RB1, PAWK, PCBP1, CRN22, PCN22, PCN22, RPS20, RPS20, SETDB 1, SF3A2, SETDB 1 New small molecule inhibitor of a POSH polypeptide useful e.g. to inhibit ubiquitin ligase activity of polypeptide, to treat viral infections, neurological disorder e.g. Alzheimer's disease, and to treat or prevent Levi-Hacham O; Claim 45; SEQ ID NO 9; 171pp; English. 11-JUL-2003; 2003US-0486730P.

ö transport of amyloid precursor protein (APP) in a cell or cell proliferation or amyloid polypeptide production in a cell and also for the treatment of a viral infection (an envelope, a retroviral or a human immunodeficiency viral infections) or neurological disorder (Alzheimer's disease, Parkinson's disease, Huntington's disease, Pick's disease, depression or schizophrenia). The inhibitor is also useful in the treatment and prevention of cancer, in a method of inhibiting ubiquitin ligase activity of a polypeptide, for maturation of a virus in a cell, for transport of APP and is capable of targeting one or more proteins. The products of the invention have cytostatic, virucide, anti-HIV, cerebroprotective, nootropic, anticonvulsant, antiparkinsonian, cerebroprotective, antidepressant and neuroleptic activity. This sequence represents a mouse POSH protein. This sequence represents a mouse ubiquitin (Ub) ligase, plenty of SH3 domains (POSH). The composition of the invention comprises a human POSH polypeptide and a POSH-associated protein (POSH-AP), or a polypeptide comprising a domain that is 90% indentical to a POSH SH3 domain and a POSH involved in many cellular processes, including viral maturation, stimulating ubiquitinylation of certain proteins, vesicular trafficking, regulating Rac or JNK signaling pathway, etc. An antibody which is rimmunoreactive with the epitope of human POSH amino acid sequence, where the antibody disrupts the interaction between a POSH polypeptide and a POSH-AP may be used for inhibiting viral infection. The POSH-AP comprises Isolated, purified or recombinant complex useful for identifying antiviral agent and anti-apoptotic agent, comprises plenty of SH3 domains POSH polypeptide and POSH-associated proteins POSH-AP. The invention relates to a novel method for identifying a protein substrate for an E3 protein comprising expression of an E3 protein, a bait fusion protein and a prey fusion protein in a cell, where the E3 protein that is a protein substrate of the bait protein to a prey protein that is a protein substrate of the E3 protein. The physical protein inmediated proteins induces an output signal which is detected. The ubiquitin-mediated proteolysis system is the major pathway for the selective, controlled degradation of intracellular proteins in eukaryotic cells. The process of degradation is catalyzed by a ubiquitin-activating enzyme (E1) and a ubiquitin-conjugating enzyme (E2), but may also require auxiliary substrate recognition proteins (E3s). The method of the continum may be useful for identifying a protein substrate for an E3 protein, which is subsequently useful for mediating ligation of ubiquitin or ubiquitin-like proteins. The current sequence is that of the murine POSH (plenty of SH3 domains) protein of the invention.
                                                                                                                                                                                      ö
BE2, which is chosen from UBC13, UBC5a, UBC5c and UBC6. The UBC13 is in a heterodimeric complex with a Ub conjugating enzyme variant (UBV) protein eg. UBV1a. The composition of the invention is useful for identifying an anti-viral agent and an anti-apoptotic agent, which involves identifying a test agent that disrupts the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful to allow

The invention relates to a method for identifying an agent that modulates
an activity of a HERPUDI polypeptide. The method comprises identifying an
agent that modulates a complex comprising a HERPUDI
colypeptide, where an agent that modulates a complex comprising a HERPUDI
colypeptide and a Nef polypeptide is an agent that modulates an activity
of the HERPUDI polypeptide. Also described: (1) a method of inhibiting a
contining the progression of AIDS in a subject infected with HIV; (3) an
colypeptide and a Nef polypeptide; (4) a method of inhibiting a
colypeptide and a Nef polypeptide; (4) a method of identifying an
activity an enter, (5) a method of inhibiting viral replication in a cell;
colypeptide; and (8) a Nef polypeptide. The methods are useful for
colypeptide; and (8) a Nef polypeptide. The methods are useful for
colypeptide; and (8) a Nef polypeptide. The methods are useful for
collibiting a Nef-mediated process in a cellinfected with HIV, and
cinhibiting a progression of AIDS in a subject infected with HIV, and
conhibiting the progression of AIDS in a subject infected with HIV. The
control of collibiting a viral infected with HIV, and
collibiting the progression of AIDS in a subject infected with HIV. The
collibiting a Nef-mediated process in a cell infected with HIV. The
collibiting a Nef-mediated polypeptide in a subject infected with HIV. The

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal cativity of (II) in or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal conspicul for generating antibodies against it, detecting or quantitating a polyment. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in colyppeptide and polymucleotide sequences have applications in colyppeptide for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this gratem tid not appear in the printed specification, but was obtained in colfpection int/pub/published_pct_esquences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed can dispuse therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for spencating and its binding partners are useful in medical imaging colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diaponostics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 49; DB 4; Length 1444;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher elucatores for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher useryers for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proreins (ABB37737-ABB32072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, p53 pathway, therapeutic, angiogenic disorder, apoptotic disorder, chromodomain helicase DNA binding protein, CHD, cancer, gene therapy, cell proliferative disorder, chromatin organisation modifier domain;
                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Funke RP;

The present invention relates to a method for identifying candidate p53 pathway modulating agents. The method involves contacting an assay system comprising purified chromatin organisation modifier (chromo) domain helicase DNA binding proteins (CHD), nucleic acids, their functionally active fragments or derivatives, with a test agent under conditions where, but for the presence of the test agent, the system provides a reference activity. The methods are useful for identifying modulators of the p53 pathway as therapeutic targets for disorders associated with defective p53 function, such as anglogenic disorders, apoptotic disorders or cell proliferative disorders, e.g. cancer. The modulators are useful as research reagents, diagnostics and therapeutics. The invention is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antiinflammatory, Antiarteriosclerotic, Antipsoriatic, Gynaecological, Vasotropic, Vulnerary, Hypotensive, Antianginal; Cardiant, Osteopathic, gene therapy, antiangiogenic, tumour vascularisation, retinopathy: rheumatoid arthritis, Crohn disease, atherosclerosis, ovarian hyperstimulation; psoriasis, endometriosis, neovascularization, restenosis, cardiovascular disease; hypertension; Raynaud disease; muscular degeneration; osteoporosis, human; CHD3.
Identifying a candidate p53 pathway-modulating agent as therapeutic targets for disorders related to defective p53 function e.g. cancer by contacting an assay system having purified CHD polypeptide or nucleic acid, with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiangiogenic composition, useful for treating e.g. tumors, comprises new angiogenesis-related nucleic acids or related polypeptides, antibodies or antisense sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Claim 5; SEQ ID NO 34; 110pp; French.

atherosclerosis; ovarian hyperstimulation; psoriasis; endometriosis associated with neovascularization; restenosis (arterial or after balloon angioplasty); overgrowth of cells in wound healing; peripheral vascular disease; hypertension; vascular inflammation; Raymaud disease; aneurysm; thrombophlebitis; lymphedema; ischaemia; angina; myocardial infarct; ofronic heart disease; (congestive) cardiac insufficiency; age-related muscular degeneration and osteoporosis. This sequence is chromodomain helicase DNA binding protein 3 (CHD3). The present invention relates to antiangiogenic pharmaceutical compositions. The compositions comprise, as active ingredient, one or more of: nucleic acid (I; ADI26740-ADI26744 and ADI2676-ADI26769) from an endothelial cell gene the expression of which is induced by an angiogenic agent, or its complement or fragment; polypeptide (II; ADI26745-ADI26749 and ADI26770-ADI26773) encoded by (I), or its fragment; an antisense nucleic acid (III; ADI26773) encoded by (I), or its fragment; expression of (I); or an antibody (Ab) that binds (II). The compositions are used for treating a wide range of angiogenic diseases: tumour vascularisation; retinopathy; rheumatoid arthritis; (rohalicialicialism)
